

Ripple Tool - Trims an Edit without Leaving a Gap

A ripple edit adjusts a clip's In or Out point, making the clip longer or shorter, without leaving a gap in the Timeline. The change in the clip's duration ripples outward, moving all subsequent clips earlier or later in the Timeline. If you don't use a ripple edit when you change the duration of a clip, you will either leave a gap when you make a clip shorter, or overwrite part of an existing clip if you make a clip longer.

A ripple edit is a one-sided edit, meaning that only an In or Out point of a single clip item is affected. All clips following the shortened or extended clip are moved accordingly in the Timeline, so ripple edits affect both the trimmed clip and the position of all subsequent clips in the Timeline.

Important: Ripple edits can be dangerous if you are trying to maintain sync between clip items on different tracks, since all of the clip items on one track may move forward or backward while the clip items on other tracks don't.

Ripple edits are done using the Ripple tool.
